meetily-plus build sheet

Custom features in this fork of Zackriya-Solutions/meetily, what changed, and how each was verified.

- **Fork:** `SalehAhmed10/meetily`, daily branch `feat/import-transcript` (based on upstream `main`, v0.4.1)
- **Installed as:** `meetily-plus` in `%LOCALAPPDATA%\meetily-plus`, next to the official `meetily`
- **Data:** `%APPDATA%\com.saleh.meetily` (own database). `models\` is a junction to the official app's models, so nothing is downloaded twice
- **Rebuild:** `git fetch upstream && git merge upstream/main`, then `./frontend/build-plus.sh --install` (close the app first)
- **Regenerate the PDF:** `python docs/meetily-plus/make_pdf.py`

> Keeping this current: every feature or fix added to the fork gets a row in **Features** and an entry in **Change log**, in the same commit as the code, and the PDF is regenerated.

Features

#	Feature	What it does	Verified by	Upstream
1	Import Transcript	Sidebar button imports `.txt`, `.md`, `.srt`, `.vtt` (and `.docx`, row 7) as a meeting. Subtitle cue times kept, VTT `<v Speaker>` tags become `Speaker:`. Google Meet / Tactiq `.txt` exports: leading `MM:SS` / `H:MM:SS` / `[00:05]` times are read, notes header kept untimed, list lines join the speaker's turn	7 parser and database tests; imported real Teams-style VTT and Meet TXT	Issue #902, PR #903 (open)
2	GPU summaries	Built-in summary model runs on the GPU (Vulkan). llama-helper asks llama.cpp (`llama_params_fit`) how many layers fit instead of guessing: 33/33 layers on the RTX 5050	Same 11k-token request 101.6 s -> 14.8 s; contract meeting summary 791.6 s (CPU build) -> 44.8 s	Comment on issue #552; PR not opened (maintainers plan to replace llama-helper, see #683)

#	Feature	What it does	Verified by	Upstream
3	Live summary progress	Spinner replaced by stage (reading N tokens / writing), estimated % (capped at 95% until done), characters, elapsed time and time left. Finished summaries show "Generated in Xs"	Helper, sidecar, query and time-left tests; seen in the app	Fork only
4	No [00:00] on untimed lines	Lines without a time (imported notes headers) show no time label	Seen in the app	Fork only
5	Projects	Assign meetings to a client/project from the picker in the transcript toolbar; create, rename, delete (meetings are kept). Sidebar groups meetings in project folders with a count	2 repository tests on real migrations, 2 grouping tests; migration run on a copy of the real database	Fork only
6	Client Scope Call template	Summary template: agreed scope, out of scope, decisions, open questions, budget/timeline, client and developer action items, follow-up email draft	Template validated against the app's schema	Not in the repo: `%APPDATA%\Meetily\templates\client_scope_call.json` (shared with the official app)
7	Import `.docx`	Teams and Google Meet (Google Doc) transcript downloads import directly: one line per paragraph, then the same time and speaker reading as `.txt`. `Name 0:03` header lines followed by the words become `Name:` with that time; files of `start --> end` cue timings are read as VTT cues, with the speaker line after each timing becoming `Name:`. Layouts are from memory of Teams/Meet exports; both were imported in the app from generated sample files, not yet from a real export	4 tests (Word XML with entities, tables and breaks; a real zipped `.docx`; cue layout; speaker-header layout, and notes left alone)	Fork only

#	Feature	What it does	Verified by	Upstream	
8	Auto-file into projects	A meeting with no project goes into the project named in its title, as a whole word, ignoring case, longest name first ("Acme Mobile kickoff" -> Acme Mobile), then the one earlier in the title. Runs when a meeting is recorded, imported or renamed, including the title the AI summary gives it, and when a project is created or renamed (only meetings naming that project). A meeting that has a project is never moved. Choosing "No project" is not remembered: a later rename or summary can file it again	5 tests, including rename on a one-connection database (no deadlock) and the import path; checked in the app (renaming a meeting to "Acme kickoff" filed it into Acme)	Fork only	
9	Project action items	Checklist icon on a sidebar project folder opens one list of the project's action items, collected from every completed summary: the Action Items table (owner, task, due, transcript time) or any list under a heading with "action item" in it. The owner comes from the table, the heading ("Client Action Items"), a subheading inside the section, or a bold "**Saleh:**" before the item; nested bullets join their item. Translated summaries are read from their English original. Grouped by meeting, newest first; tick to mark done, "Show done" brings them back. Ticks are stored in a new `action_item_status` table keyed by meeting and task text, so a regenerated summary with reworded tasks starts unticked	6 Rust tests (real table shape incl. a quoted `	` in a cell, lists, subheadings and bold owners, translated fallback, duplicates per owner, ticks on the real migrations) and 3 frontend tests; reviewed by a read-only agent, its 7 proven issues fixed	Fork only

#	Feature	What it does	Verified by	Upstream
10	One-line sidebar titles	Meeting titles in the sidebar stay on one line with "..." and show in full on hover. The edit/delete buttons float over the row end on hover or keyboard focus instead of reserving a third of the width, which is what made titles wrap onto 3-4 lines. Focus rings on the sidebar and action-items controls; action-items heading no longer has a label above it	tsc, frontend tests, Impeccable design detector (no findings in changed rows); checked in the app	Fork only
11	Summary to PDF	PDF button in the summary toolbar: the summary (with unsaved edits) becomes an A4 page with the meeting title and date, tables kept; you choose where to save and Edge/Chrome prints it in the background. The page may load nothing (Content-Security-Policy, no images, browser started with DNS disabled), since the summary is model output from possibly imported text	2 Rust tests (one renders a real PDF with Edge on this PC), HTML test	Fork only
12	Email follow-up	Email button opens your mail app with the summary's "Follow-up Email Draft" section (or the whole summary) as the body and the meeting title as subject; you add the recipient and send. The full text is also copied, since mail links cut off near 2,000 characters. Links now open through `rundll32 url.dll,FileProtocolHandler` instead of `cmd /C start`, which split URLs at `&`	4 frontend tests (draft section, encoding of `&`, long-body cut)	Fork only

#	Feature	What it does	Verified by	Upstream
13	Project timeline, emails and stages	The project button on a sidebar folder opens a project page with two tabs. **Timeline**: meetings and emails in date order, grouped by stage ("Round 1", "Phase 2"); a stage chip on each row sets it, offering stages used before. **Action items**: the list from row 9. **Add email**: paste an email or load a saved .eml/.txt; subject, sender and date are read from its headers (incl. encoded subjects, quoted-printable/base64, multipart, Outlook's copied From/Sent/Subject block); it is stored as a meeting of kind email, so search, summaries and action items work on it. Migration adds `meetings.kind` and `meetings.stage`	3 Rust tests (emails and stages on the real migrations, search snippet next to multi-byte characters), 9 frontend tests (email parsing, stage grouping); reviewed by a read-only agent, its 5 proven and 2 likely issues fixed	Fork only

Fork-only setup (not features)

Change	Why
`productName` `meetily-plus`, identifier `com.saleh.meetily`	Own install folder, uninstall entry and database; never overwrites the official app
Updater endpoint points at this fork	"Update" can no longer install the official build over this one
`createUpdaterArtifacts` off; signing disabled at build time	Both need upstream's private keys
`frontend/build-plus.sh`, `frontend/build-llama-helper-vulkan.bat`	One-command Windows build: libclang 18 pin, Vulkan helper built with Ninja, installer

Build environment (this PC)

Need	Detail
Rust, CMake, VS 2022 Build Tools (C++), LLVM, Vulkan SDK	Installed with winget
libclang 18	`C:\Users\LMAhm\tools\libclang-18` (PyPI `libclang==18.1.1`). LLVM 23's libclang breaks whisper-rs-sys bindings
Build output	`C:\cargo-target\meetily` (drive H: was full)
Ninja for the Vulkan helper	MSBuild runs llama.cpp's shader-generator steps out of order on this machine
Rust tests	Set `ORT_DYLIB_PATH` to `frontend/src-tauri/binaries/onnxruntime/onnxruntime.dll`, or 7 VAD tests load the old system ONNX Runtime

Change log

Date	Commit	Change
2026-11-03	`9d00667`	feat: import transcripts (.txt/.md/.srt/.vtt) as meetings
2026-11-03	`9dca0fb`	chore(fork): ship as meetily-plus beside the official app
2026-11-03	`ab3d1c1`, `fbccbaa`	fix(import): whitespace-only cue separators, no title in logs; README note
2026-11-03	`11a0548`	fix(llama-helper): let llama.cpp fit GPU offload to free VRAM
2026-11-03	`36e5a3c`	chore(fork): build llama-helper with Vulkan via Ninja
2026-11-03	`f12e6a7`	feat(summary): live progress and "Generated in Xs"

Date	Commit	Change
2026-11-03	`15636a0`	fix(import): read leading timestamps in plain-text transcripts
2026-11-03	`93740a9`	fix(transcript): no [00:00] label on lines without a time
2026-11-03	`b6241d8`	feat(projects): group meetings by client/project
2026-11-03	`d756acf`	feat(projects): picker inline in the transcript toolbar, folder icon and count badge in the sidebar; this build sheet
2026-11-03	`ef29f5e`	feat(import): `.docx` transcripts; feat(projects): auto-file meetings into the project named in their title
2026-11-03	`b32a5c6`	feat(projects): creating or renaming a project files existing meetings that name it; fix(import): `Name:` after the speaker in Teams cue layout
2026-11-03	`d3f357b`, `305b728`	feat(projects): action items page per project, ticked off and remembered
2026-11-03	`2331cf7`	polish(ui): one-line sidebar titles, floating row actions, focus rings
2026-11-03	`55acccf`	feat(summary): PDF export and email follow-up; fix: open links containing `&` on Windows; fix(projects): "Pending" due dates read as none
2026-11-03	`15a6480`	fix(security): PDF export page cannot fetch anything (CSP, images dropped, no DNS); found by the automated security review
2026-11-03	`d8fcc72`	feat(projects): project page with timeline, emails and stages
2026-11-03	(this commit)	fix: review of the timeline: pasted first line kept, picked date kept, attachments skipped, HTML entities decoded; transcripts without times keep their order; search no longer panics next to curly quotes/em dashes

Next

- **Ask a project:** ask questions across one client's meetings, answered by the local model with the call and timestamp each point came from. Needs Projects (done).
- **Project brief and next-round prep:** the local model reads a project's summaries and emails in order and writes status, stage outcomes and a prep checklist. Pairs with Ask a project (fresh session).
- Later: speaker names per project, meeting hours per project.
